

# Build

# Code

```

//There are 2 ways to wake up a system, those are called Interrupts
//hardware Interrupts is based on external events where signals are sent to the GPIO
//Software Interrupts occur when we program the device like through a wake up alarm or timer

#define uS_TO_S_FACTOR 1000000 //Equation to convert milliseconds to Minutes
#define TIME_TO_SLEEP 10 //Determined amount of minutes at sleep

RTC_DATA_ATTR int bootCount = 0;

//Keeps data of times awaken in internal RTC

*****Wake Up Print
*****

void print_wakeup_reason(){ //Set up to list reasons for system wake-up
    esp_sleep_wakeup_cause_t wakeup_reason;

    wakeup_reason = esp_sleep_get_wakeup_cause(); //System wakes up due to 3 reasons
  
```

```

switch(wakeup_reason)
{
  case ESP_SLEEP_WAKEUP_EXT0 : Serial.println("PUSHED BUTTON caused the
system to WAKEUP"); break;
  case ESP_SLEEP_WAKEUP_TIMER : Serial.println("TIMER caused the system to
WAKEUP"); break;
  default : Serial.printf("DeepSleep didn't wake up ESP32:
%d\n",wakeup_reason); break;  */Initial Boot will yield this reason
}
}

*/We made the system wake up due to the internal timer and a pushed button,
the reason for the push button is that in the case we want to take a
measurement at our will without having to wait for the timers.

void setup(){
  Serial.begin(115200);
  delay(1000);

  pinMode(32,OUTPUT);          */Illuminates a LED when the system is awake.
For visual confirmation.

  pinMode(33,INPUT_PULLUP);

  */ESP32 has pull-up resistors built on the pins, when we activate it
*/it avoids the use of external resistors
*/INPUT_PULLUP keeps the signal HIGH by default
*/floating currents which can produce erroneous readings are avoided by
pull up/down resistors

  for(int i=0;i<5;i++)
  {
    digitalWrite(32,HIGH);      */ This are the parameters for the LED
flashing
    delay(1000);
