How to setup a virtual machine with Ubuntu 20.04

Virtualization technologies such as virtual machines allow us to experience other operating systems without affecting, removing or changing our default operating system, you can think of it as a “virtual computer” inside your “real computer”, this allows us to create multiple virtual machines on our computer.

Before starting it is necessary to **download and install** the software VMware Workstation Player , if you are a **Windows 64-bit user** you can download it from this link. If you are a Mac OS user you can download VirtualBox directly from this link
