Image Classification Game: Part 1

This Snap! game uses Nvidia Jetson capability to classify images.

Offline Snap! downloading

Please download and open Offline version of Snap! for our project. Go to https://snap.berkeley.edu/offline and follow the steps.

Snap! files' downloading

Please open the link Classification Game to download our project on your computer. Probably you would see the xml in raw format. Click the right button of your mouse and save it on the disk.

Web camera Image in Snap!

You can get picture from your web camera in Snap!.

• video capture block to enable video capturing.

set video capture 🗸 to 🔨

• Change value of set video transparency block to 0 for clear image.

set video transparency to 🕕

• video snap on stage block reports picture from stage.

video snap v on Stage v

Last update: 2022/08/06 snapcon2022:image-classification-game https://wiki.eolab.de/doku.php?id=snapcon2022:image-classification-game&rev=1659796237 16:30

Connection to Jetson from Snap!

If you have not imported it yet, please download jetson blocks and import it to your Snap! project.

Response from classification

Here we will send **video snap on stage** to Jetson for processing. Jetson will respond back class name, confidence value and class ID.

- Use get response from Jetson block to send image , and get class name and confidence value.
 - First input slot is for **jetson** variable that stores websocket data.
 - $\circ\,$ Second input slot is for ${\color{black} costume}$ you want to be classified by Nvidia Jetson.

Class name and confidence value

This section will demonstrate how to handle **response** variable to access **class name** and **confidence value.**

• class name is the 2nd item of 1st item of response block.

Speech functionality

Speech functionality is available as a library in Snap!. Select *export libraries* from settings then choose *speech module* .

• Use join block to create text like I am confidence percent sure, it is class name .

Repeat block for game

Last step is adding loop for the game.

• Use repeat block and put script inside of it.

Image Classification Game: Part 2

Please open the link Classification Game: Extended to download the extended version of our project on your computer.

Start Camera

Drag and drop the **start video** custom block to start using web camera.

Connection to Jetson

Repeat the steps from Part 1 to connect to the Jetson Computer.

Game Initialization

Use When flag clicked , variable setting and our custom blocks for initializing the game

Game process control blocks

In the game process we use **when** block to catch the click event from the stage and change the current page and broadcasting to tell the other blocks that game is starting.

when start label is clicked
set current_page to (game page)
render current_page
broadcast start_game to all 4
wait until not mouse down?

Also we added additional blocks to resume the game after it was stopped.

Main part: sending images to Jetson and having fun with our pets! :-)

We use familiar **when** block to listen to the start event. Then the block for receiving classification data is used in connection with **analyze** block

Last update: 2022/08/06 snapcon2022:image-classification-game https://wiki.eolab.de/doku.php?id=snapcon2022:image-classification-game&rev=1659796237 16:30

Inside **analyze** block we compare the class name with preset class names of food, that our pets consume, and broadcast to them. In case if the detected object is not suitable for any of them, we run **speak** block to pronounce the name of the object.

+ analyze + found + class +
if (class_name) = (an1_food)
broadcast rabbit_choice v to Rabbit v
else
if class_name = an2_food
broadcast monkey_choice to Monkey 4
else
if (class_name) = (an3_food)
broadcast mouse_choice - to Mouse - 4
else
if (class_name) = (an4_food)
broadcast squirrel_choice to Squirrel
else
if an5_food_list contains class_name
broadcast worm_choice v to Worm v 4
else
speak join guess, it is class_name () with en-GB accent
and pitch 1 rate 1

In the script part of each sprite there are already blocks, responsible for handling their choice events. We use **speak** , **play sound** , **animate** blocks to animate the sprites.
